

EXPERIMENT 18: Prolog Program for a DB with Name and DOB**Aim**

To write and execute a Prolog program to create a database containing persons' names and dates of birth and retrieve the required information using queries.

Algorithm

1. Start the Prolog program.
2. Define facts containing the person's name and date of birth.
3. Store the facts in the Prolog knowledge base.
4. Define queries to retrieve the name or date of birth.
5. Execute the required query.
6. Display the matching result.
7. Stop.

Program Code:

% Database of persons with Name and Date of Birth

person(sameer, date(15, 5, 2006)).

person(rahul, date(20, 8, 2005)).

person(ashwin, date(10, 2, 2007)).

person(priya, date(25, 12, 2006)).

% Query person's date of birth

dob(Name, Date) :-

person(Name, Date).

Output:

```
compiling C:/Users/Hp/Documents/EX-18.1.pl for byte code...
C:/Users/Hp/Documents/EX-18.1.pl compiled, 9 lines read - 1025 bytes written,

yes
| ?- dob(sameer, Date).

Date = date(15,5,2006)

yes
| ?- ?- person(Name, date(20, 8, 2005)).
uncaught exception: error(existence_error(procedure,(?)/1),top_level/0)
| ?- person(Name, date(20, 8, 2005)).

Name = rahul ? |
```

Result

The Prolog database containing names and dates of birth was successfully created. The required information was retrieved correctly using Prolog queries.
